Enjaz Continuation Plan v1.0 | خطة الاستكمال

Prepared for Mohamed Gamal — Nov 2026 — Save this file in the repository root as PLAN.md.

> ملاحظة بالعربي: الملف ده بيرتّب الشغل من أول ما وصلنا لحد دلوقتي: إيه اللي حصل، إيه اللي بايظ، وإيه اللي هنعمله وبأي ترتيب. هو اللي بيحدد **الترتيب**، والملفات التانية (SPEC وCHANGES وVOICE وUI) بتحدد **التفاصيل**. دفعة واحدة في كل مرة، وكل دفعة بتتجرب على موبايلك قبل اللي بعدها.

0. Instructions to the AI coding agent (read first)

1. This file decides the ORDER of the work. Each batch below points to the file and section that define the details. If two files conflict about a feature, the more specific file wins (VOICE.md for the voice assistant, UI.md for look and navigation, CHANGES.md for rounds 0 to 7, SPEC.md for the base app). Any idea of a cloud or AI assistant, and any INTERNET permission, has been dropped.
2. The owner is NOT a programmer. Talk to him in simple Egyptian Arabic. Give every action he must take as short numbered steps.
3. One batch at a time. Never start the next batch. Never add anything outside the current batch.
4. Every batch starts with a short plan in Arabic and waits for the owner's approval. Batch 0 starts with a READ-ONLY investigation: change nothing until the owner approves the diagnosis.
5. Never touch signing: build_apk.yml, android/expected_cert_sha256.txt and the GitHub Secrets stay as they are. Every APK must install over the previous one (same key, higher version code).
6. Never wipe or reset user data. Database changes are new migrations tested by migrating a REAL database file filled with sample data, not by checking SQL text.
7. Do not write 'done' or '100 percent' unless you verified it. Label every item as: verified by tests, verified by build, or NEEDS A REAL-DEVICE TEST. Do not claim that anything works on the owner's phone (alarms, microphone, speech recognition, notifications, Excel opening) until he confirms it.
8. All user-visible text goes through ARB files. All colors and sizes come from tokens. No new permissions. No networking library. No INTERNET permission.
9. Every batch ends with: tests passing, README.md, CHANGELOG.md and DECISIONS.md updated, a commit, a tag (batch-0, batch-1...), a CI-built APK as a GitHub Release, and a short plain-Arabic test checklist for the owner.

10. Model effort guide (for the owner's credits): the hard batches (0, 1 migrations, 2) use the strongest model at Medium; text, screens and UI use a mid model at Low or Medium; small edits use the cheapest model. Raise the effort only after two failed attempts on the same problem.

1. Where we are (facts)

- Version 1.2.0, versionCode 2018, package com.enjaz.app, arm64 only, about 34.7 MB, targetSdk 34.
- Signed with the permanent key. SHA-256: 7A:1D:0C:B1:DE:27:6F:B0:92:08:1D:D1:33:4C:D7:17:38:5C:5F:63:86:6D:7D:BA:63:BD:8E:D6:F2:5F:AE:F7 (checked on the 1.2.0 APK; the CI log reports the same for 1.1.5).
- Permissions in 1.2.0: ACCESS_NETWORK_STATE, POST_NOTIFICATIONS, RECEIVE_BOOT_COMPLETED, RECORD_AUDIO, SCHEDULE_EXACT_ALARM, USE_BIOMETRIC, USE_FINGERPRINT, VIBRATE, WAKE_LOCK. USE_EXACT_ALARM was removed and WAKE_LOCK added compared with the older builds. There is no INTERNET permission.
- Built, according to the previous reports: the rounds of CHANGES.md up to health, and parts of the voice assistant, delivered together in 1.2.0. It is NOT confirmed whether the timeline (Round 7) and the UI refresh (UI.md) exist. The report status_report.csv (285 rows) lists the status of each item.
- Gaps the agent reported itself: the trash does not show goals and ideas for restore; the assistant counts done events while the dashboard counts distinct tasks; editing a voice command does not carry every parsed field; the finance analysis does not display weekday spending and biggest expenses; timeline entries open the generic section instead of the item; recovery of an unsaved recording after a crash is missing; hardcoded texts exist (some in assistant screens); the CI does not check that INTERNET is absent; some upgrade tests check SQL text instead of upgrading a real database; the help page does not cover all commands.
- Problems the owner reported on 1.2.0: (A) alarms and reminders no longer ring and show no notification; (B) the microphone of the voice assistant does not work. Both are unverified causes. Hypotheses to CHECK, not to assume: exact-alarm permission not granted on Android 12 and above; notification permission reset by a reinstall; notification channels recreated with a new sound or importance; battery restrictions on the phone; RECORD_AUDIO reset by a reinstall; the speech recognition service missing or disabled on the phone; the recognizer returning an error that the app swallows.

2. The batches

Batch	Content	Details in	Model effort
0	URGENT: alarms and microphone	section 3	Strongest, Medium
1	Data protection: trash for every module, recoverable recordings, real migration tests, no-INTERNET check	section 4	Strongest for migrations, mid for the rest
2	Finish the voice assistant: numbers, editing, help, texts	section 5 and VOICE.md	Strongest, Medium
3	Finance, calendar and reports	section 6	Mid
4	Language, numerals, themes, font scale, performance	section 7	Mid
5	UI refresh	UI.md steps 1 to 3	Mid
6	Release preparation (only if the owner asks)	CHANGES.md Round 8	Mid

3. Batch 0 — Alarms and microphone (urgent)

3.1 Investigation first, read-only.

- Compare v1.1.5 and v1.2.0 (git diff v1.1.5..v1.2.0) for: the manifest, the notification service, the reminder scheduler, the alarm channels and the speech services. List what changed.
- Answer in plain words: Does the app check canScheduleExactAlarms before scheduling? What happens when scheduling fails: is the failure silent? Which notification channels exist, with which importance and sound? Is POST_NOTIFICATIONS requested at runtime? Does the app check RECORD_AUDIO and the availability of a speech recognizer before listening? What does it do with recognizer errors?
- Report the cause or the most likely causes with evidence from the code. Do not change anything until the owner approves.

3.2 The fixes (after approval).

- Before every alarm or reminder scheduling: check the notification permission and the exact-alarm permission. If the exact-alarm permission is missing: show a clear Arabic message and a button that opens the system setting 'التنبيهات والتذكيرات', and fall back to an inexact schedule instead of failing.
- No silent failure: every failure to schedule or to play a sound appears in the screen 'فحص التنبيهات' with the reason. The screen also shows the state of each permission and channel, and keeps its button 'اختبار المنبه بعد 10 ثواني'.
- Make the alarm channel and the normal channel verifiable: the test button must ring or notify with the app in the background and the screen locked.
- Microphone: check RECORD_AUDIO and the recognizer availability before listening. One Arabic message for each case: permission denied, permission denied permanently (button to open the app settings), recognition service missing or disabled (button to open the system speech settings and a note that typing still works), no network when the phone needs it, and any other error with its code. The typed-sentence field always works.
- Unit tests for every check and message. Do not claim that the alarm or the microphone works on the phone: list them under NEEDS A REAL-DEVICE TEST.

3.3 Owner checklist (Arabic).

1. إعدادات التطبيق: الإشعارات مسموحة، الميكروفون مسموح، 'التنبيهات والتذكيرات' مسموحة، التشغيل التلقائي مفعّل، البطارية بدون قيود.
2. افتح فحص التنبيهات وصوّره، واضغط اختبار المنبه بعد 10 ثواني وأقفل الشاشة.
3. اعمل منبه لمهمة بعد دقيقتين وأقفل الشاشة.
4. أعد تشغيل الموبايل وتأكد إن منبه محطوط قبلها لسه شغال.
5. افتح اختبار الميكروفون وقل جملة، وجرّب كمان بوضع الطيران.

Done when: the owner confirms the alarm rings with the screen locked and after a reboot, and the microphone test shows a transcript or a clear Arabic reason.

4. Batch 1 — Data protection

- **Trash for every module:** the trash screen lists every soft-deleted item of every module (tasks, errands, goals, ideas, notes, habits, expenses, income, wishlist, obligations, health items, treatments). Each can be restored. Permanent delete, one item and empty trash, asks for confirmation and removes the item's voice files and reminders.
- **Unsaved recording recovery:** after a crash or a forced stop, the next start offers to keep or discard the unsaved temporary recordings (SPEC extension 14.3).

- **Real migration tests:** keep a database file from v1.1.5 with sample data in the test assets, migrate it to the current schema, and check the data. Replace tests that only check SQL text.
- **No INTERNET check:** the CI fails if the merged release manifest contains the INTERNET permission.
- **Reminders audit:** after a reboot, an app update, a timezone change and a backup restore, every reminder is scheduled again (CHANGES.md 1.2). Test it.
- **Backup and restore with a recording:** export, restore, play the recording. Test it.

Done when: the owner deletes an item of each module, restores it from the trash, and a backup with a recording restores and plays.

5. Batch 2 — Finish the voice assistant

The details are in VOICE.md. In this batch:

- **One source of truth for numbers:** the assistant uses the same services as the dashboard. Define 'done count' exactly as the dashboard does (distinct tasks completed in the range, CHANGES.md section 7). A task reopened and completed again counts once. Add tests that compare the assistant's answers with the dashboard for scripted questions.
- **Editing a command:** the edit sheet opens pre-filled with every parsed field (amount, category, date, time, note text, idea text). Nothing the assistant understood may be lost.
- **Confirmation and undo:** tap and voice confirmation, cancel, and the Undo snackbar work for every command type.
- **Help page:** lists every command and question with examples (VOICE.md sections 5 and 6).
- **Texts:** move all hardcoded texts of the assistant screens to ARB files.
- **Corpus and speech tests:** the phrase corpus passes (VOICE.md 10.1). The speech test report of VOICE.md 10.3 is written from the owner's phone.

Done when: the owner asks 'ملخص الشهر ده' and the numbers equal the Stats screen, and a spoken expense can be edited without losing fields.

6. Batch 3 — Finance, calendar and reports

- **Finance analysis screen:** show spending by weekday and the five biggest expenses (CHANGES.md 5.4).

- **Timeline:** every entry opens its own item (task, note, expense, habit log, health item), not the generic section.
- **Excel report:** numbers equal the dashboard for week, month, year and all time (a unit test with a sample dataset). The file opens in Excel and Google Sheets with Arabic correct and right-to-left (the owner opens it on his laptop).

Done when: the owner compares three numbers in the Excel file with the Stats screen and they match.

7. Batch 4 — Language, numerals, themes, font scale, performance

- A test or script that finds hardcoded user-visible text outside the ARB files and fails the build.
- Numerals follow the setting everywhere (dates, counters, chips, amounts).
- Light and dark themes: check every screen. Font scale 1.3: nothing is clipped.
- Performance: lists with 5,000 tasks and five years of data stay smooth. Measure and report the numbers.
- Contrast: a unit test for all token pairs (UI.md section 3).

8. Batch 5 — UI refresh

Follow UI.md exactly, steps 1 to 3. UI.md must be in the project folder first. The visual reference is the canvas the owner attaches (Home, More, Tasks, Add menu, Finance). Screenshots before and after from the owner's phone after each step.

9. Batch 6 — Release preparation

Only if the owner asks. Follow CHANGES.md Round 8.

10. How the owner works with the agent

1. One agent at a time on the same files. One batch at a time.
2. Read-only investigation first for any bug.
3. Before installing any APK: install it OVER the old one without uninstalling. If Android refuses, stop and ask. Export an encrypted backup first if the data matters.
4. After each batch: run the checklist on the phone and write down anything wrong with a precise description: what I did, what happened, what I expected.
5. Check Settings > Usage in Codex before a big task.

11. Kickoff messages

Batch 0 (investigation first):

> ابدأ من PLAN.md فقط، الدفعة 0 (القسم 3). ابدأ بالتحقيق للقراءة فقط (3.1) ولا تعدّل أي حاجة. قارن v1.1.5 مع v1.2.0 وقولي السبب أو الأسباب المحتملة بالدليل من الكود. اعرض خطتك بالعربي وانتظر موافقتي. ما تلمسش التوقيع.

Any other batch:

> ابدأ من PLAN.md فقط، الدفعة N. اقرأ القسمين 0 و10 مع قسم الدفعة والملفات اللي بيشير لها. اعمل خطة قصيرة بالعربي وانتظر موافقتي، وبعدها نفّذ. ما تبدأش دفعة تانية. في الآخر: الاختبارات، README وCHANGELOG وcommit، DECISIONS وtag باسم batch-N وRelease رسمي للـ APK، وقايمة تجربة قصيرة بالعربي لموبايلي. وصرّح بكل حاجة محتاجة تجربة على جهاز حقيقي.
